*milling drums,
what are they used for?*

*milling drums are used in the last
step of leather tanning operations.*

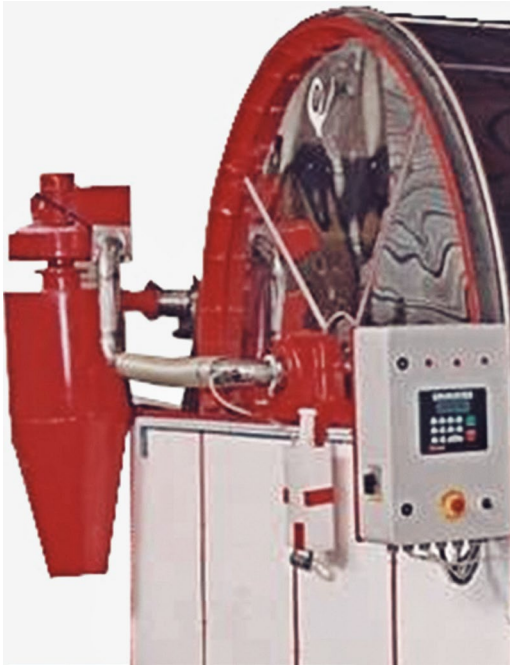

*basically; heating, accumulation
of dusts and humidifying
operations can be done.*

*dry milling, is the stage that
determines the final appearance
and surface properties of the
leather.*

*in addition, mechanical effect is
given to product; with shelves
and pegs located on the inner
surface of milling drum.*

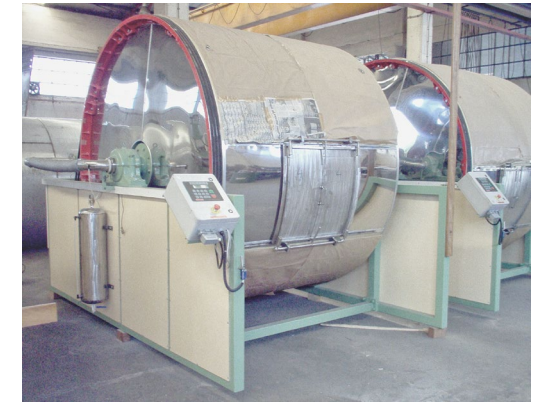

milling
drum

heating: the transfer oil in the air heating tank is heated with resistances. the air, circulated with fan motor, is heated and circulates when it passes through the tank.

“completely flexible production according to customer demands”

milling drums in required capacities and dimensions

with more than 30 years of export experience, we offer optimum support in trade and transportation.

on-site installation service

dust accumulation: there is a particulate trap inside the dust collection tank. particles, inside the circulated air with fan motor, are caught by this trap. so clean air joins and continuous circulation.

humidifying: water inside the tank, is spouted to inside of drum from burner nozzle in planning gaps.

[2700 square meters of production area]

world standards in tannery machines

our after-sales support, service and spare parts service policy is; fast and customer satisfaction oriented.

hisar stands out with its 50 years of experience and achievements in its own sector; provides first-class service in manufacturing, service and spare parts.

hisar has manufactured nearly 2000 machines and delivered all over the world. also hisar's export rate in recent years is 90% or more of its yearly production.

"why hisar ?"

the entire production of hisar takes place in its own production workshop, thus quality control is carried out at every moment of production.

hisar; aiming to be high quality, standard and economical in all machines.

besides manufacturing, we also offer you engineering solutions.

*since 1973,
we are producing for you*
